This sequence encodes a mutated version of the full length stetoclastogenesis inhibitory factor (OCIF) of the invention. This sequence encodes OCIF-CC in which amino acids 331-380 of the mature protein have been deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C. of mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. ocIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g. osteoporosis.
                                                                                                                                                                                                                                                                                 Ĥ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           for bone resorption control, esp. treatment of osteoporosis
Claim 45; Page 138-139; 183pp; Japanese.
This sequence encodes a mutated version of the full length
osteoclastogenesis inhibitory factor (OCIF) of the invention. This
sequence encodes OCIF-DCR2 in which amino acids 43-84 of the mature
protein have been deleted. The OCIF of the invention has a molecular
weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under
non-reducing conditions. The protein is adsorbed onto cation-exchangers
or heparin and its activity is lowered after 10 mins at 70 deg.C or 30
mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful
in the control of bone resorption and therefore in the treatment and
prevention of disorders of bone resorption, e.g. osteoporosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 δ
          This sequence encodes a mutted version of the full length
Osteoclastogenesis inhibitory factor (OCIF) of the invention. This
Sequence encodes OCIF-CSph in which amino acids 298-380 of the mature
protein have been deleted and replaced by Ser-Leu-Asp. These amino
acid changes have been caused by the introduction of a restriction
site. The OCIF of the invention has a molecular weight by SDS-PAGE of
60 kp under reducing conditions and 120 kb under non-reducing
conditions. The protein is adsorbed onto cation-exchangers or heparin
and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56
deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the
control of bone resorption and therefore in the treatment and
prevention of disorders of bone resorption, e.g. osteoporosis.

for bone resorption control, esp. treatment of osteoporosis
Claim 48; Page 139-140; 183pp; Japanese.

This sequence encodes a mutated version of the full length
osteoclastogenesis inhibitory factor (OCIF) of the invention. This
sequence encodes OCIF-DCR3 in which amino acids 85-122 of the mature
protein have been deleted. The OCIF of the invention has a molecular
weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under
non-reducing conditions. The protein is adsorbed onto cation-exchangers
or heparin and its activity is lowered after 10 mins at 70 deg. C or 30
mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. or 30
in the control of bone resorption and therefore in the treatment and

To have been deleted. The control of the invention. This sequence encodes a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence encodes a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence encodes OCIF-DDD2 in which amino acids 253-326 of the mature protein have been deleted. The OCIF of the invention has a molecular protein have been deleted. The OCIF of the invention has a molecular concreducing conditions and 120 kb under concreducing conditions. The protein is addoorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g. osteoporosis.
                                                                                                                                                                                                                                                                                            1009 GGCCTAATGCACGCACTAAAGCACTCAAAGACGTACCACTTTCCCAAAACTGTCACTCAG 1068

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    human clone=253126 primer=M13RPl library=Morton Fetal Cochlea vector=pBluescript SR host=SOLR cells (kanamycin resistant) Rsitel=ECORI Rsite2=XhoI The cDNA was oligo (dT) primed with an XhoI restriction enzyme recognition site and an 18 base poly dT sequence. For the 5' end, the synthesized cDNA termini were treated with T4 DNA polymerase and ECORI adaptors were ligated to the blunt ends. adaptor linker: GAATTCGGCACGAG.

/organ:micro saprate holds: Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; Site_1: Not I; Site_2: Eco RI: Equal amounts of plasmid DnA from three normalized libraries (melanocyte ZNNHW, pregnant uterus NDHPU, and fetal heart NDHH19W) were mixed, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5.000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 260132-265223, 340488-345479, and 484488-489479."
